

## Section A: (5% each)

**A1.** Using  $f^{-1}(p) = (p - 10) \bmod 26$ , we have

$$\begin{array}{ll}
 p: & \begin{array}{ccccccccc} Z & K & B & D & S & K & V \\ 25 & 10 & 1 & 3 & 18 & 10 & 21 \end{array} \\
 f^{-1}(p) & \begin{array}{ccccccccc} P & B & K & M & D & S & Y & X \\ 15 & 1 & 10 & 12 & 3 & 18 & 24 & 23 \end{array} \\
 & \begin{array}{ccccccccc} 15 & 0 & 17 & 19 & 8 & 0 & 11 & \\ 5 & 17 & 0 & 2 & 19 & 8 & 14 & 13 \end{array} \\
 & \begin{array}{ccccccccc} P & A & R & T & I & A & L & & F & R & A & C & T & I & O & N \end{array}
 \end{array}$$

Thus, the original message is “PARTIAL FRACTION”.

**A2.** i) The truth set of a propositional function is the set of elements in its domain that are assigned true propositions by the function.

ii)  $x^3 - 2x^2 - x + 2 = (x - 1)(x + 1)(x - 2) = 0$

The three roots are given as follows:

$$x_1 = 1$$

$$x_2 = -1$$

$$x_3 = 2$$

The set of truth values of the propositional function  $Q(x)$  is  $\{1, -1, 2\}$ .

**A3.** Number of one-digit numbers formed is  $C(4, 1) = 4$ .

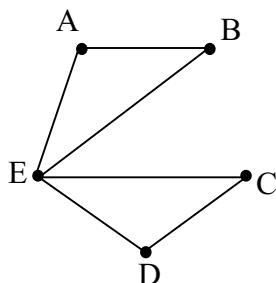

Number of two-digit numbers formed is  $P(4, 2) - C(3, 1) = 12 - 3 = 9$ .

Number of three-digit numbers formed is  $P(4, 3) - P(3, 2) = 24 - 6 = 18$ .

Number of four-digit numbers formed is  $4! - 3! = 24 - 6 = 18$ .

Then total numbers formed are  $4 + 9 + 18 + 18 = 49$ .

**A4.** Express the problem in terms of graph by taking the land areas as vertices and the bridges as edges joining the corresponding pairs of vertices

Since every vertex of G has even degree, therefore G is Eulerian.

One of the possible routes is ABECDEA.

<p><b>A5.</b> i) The required probability is <math>= \frac{^8C_3}{^{10}C_5} = \frac{56}{252} = \frac{2}{9}</math> #</p> <p>ii) The required probability is</p> $= \frac{^4C_3 \cdot ^6C_2}{^{10}C_5} + \frac{^4C_4 \cdot ^6C_1}{^{10}C_5} = \frac{60}{252} + \frac{6}{252}$ $= \frac{66}{252} = \frac{11}{42}$ #	
--	--

**A6.** We can prove that  $n^3 + n$  is even by cases.

Case (i) Suppose that  $n$  is even. Then  $n = 2k$  for some  $k \in N$ , so

$$n^3 + n = 8k^3 + 2k = 2(4k^3 + k),$$

which is even.

Case (ii) Suppose that  $n$  is odd. Then  $n = 2k + 1$  for some  $k \in N$ , so

$$n^3 + n = (8k^3 + 12k^2 + 6k + 1) + (2k + 1) = 2(4k^3 + 6k^2 + 4k + 1),$$

which is even.

Here is a more elegant proof by cases. Given  $n$  in  $N$ . We have

$n^3 + n = n(n^2 + 1)$ . If  $n$  is even, so is  $n(n^2 + 1)$ . If  $n$  is odd, then  $n^2$  is odd, hence  $n^2 + 1$  is even, and so  $n(n^2 + 1)$  is even.

**A7.** i) Assuming it is a Poisson Distribution,

$$\begin{aligned} P(0) &= e^{-3} \\ &= 0.04979 \end{aligned}$$

$$\begin{aligned} \text{ii)} \quad P(X > 3) &= 1 - P(0) - P(1) - P(2) - P(3) \\ &= 1 - e^{-3} - e^{-3}(3) - e^{-3}(3^2)/2! - e^{-3}(3^3)/3! \\ &= 0.3528 \end{aligned}$$

$$\text{A8. i)} \quad AB = \begin{bmatrix} 2 & 7 \\ 7 & 13 \end{bmatrix} \quad BA = \begin{bmatrix} 4 & 7 & 3 \\ 4 & 2 & 6 \\ 7 & 6 & 9 \end{bmatrix}$$

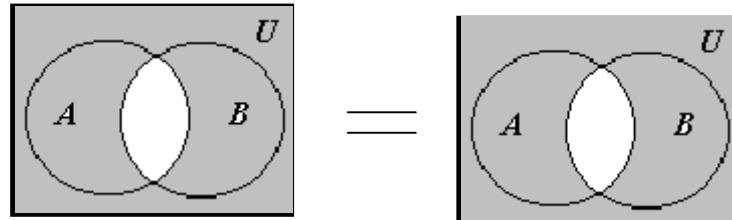

$$\begin{aligned} \text{ii)} \quad A &= \begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}^{-1} \begin{bmatrix} 3 & 0 \\ 1 & 2 \end{bmatrix} \\ &\Rightarrow \begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}^{-1} = \frac{1}{5} \begin{bmatrix} 4 & -3 \\ -1 & 2 \end{bmatrix} \end{aligned}$$

$$\Rightarrow A = \frac{1}{5} \begin{bmatrix} 4 & -3 \\ -1 & 2 \end{bmatrix} \cdot \begin{bmatrix} 3 & 0 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 9/5 & -6/5 \\ -1/5 & 4/5 \end{bmatrix}$$

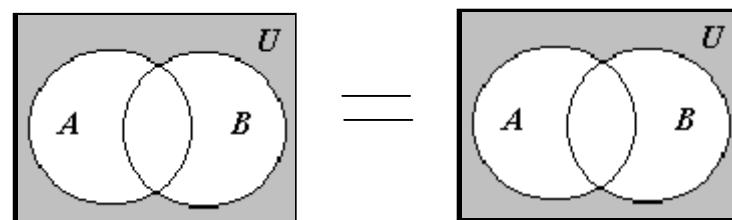

## Section B: (12% each)

**B1.** i) (a)  $1+2=3$  books  
 (b)  $1+2+3+4=10$  books  
 (c) 3 books

ii) The De Morgan's laws of algebra of sets are  $\overline{A \cap B} = \overline{A} \cup \overline{B}$

and  $\overline{A \cup B} = \overline{A} \cap \overline{B}$

**B2.** i)

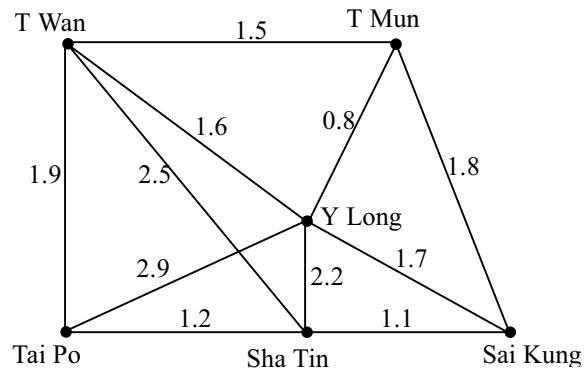

$p$	$q$	$r$	$q \vee r$	$p \vee (q \vee r)$	$\neg r$	$p \vee q$	$[(p \vee (q \vee r)) \wedge (\neg r)] \rightarrow (p \vee q)$	
T	T	T	T	T	F	T	F	T
T	T	F	T	T	T	T	T	T
T	F	T	T	T	F	T	F	T
T	F	F	F	T	T	T	T	T
F	T	T	T	T	F	T	F	T
F	T	F	T	T	T	T	T	T
F	F	T	T	T	F	F	F	T
F	F	F	F	T	T	F	F	T

The statement form  $[(p \vee (q \vee r)) \wedge (\neg r)] \rightarrow (p \vee q)$  is a tautology, hence the argument is valid.

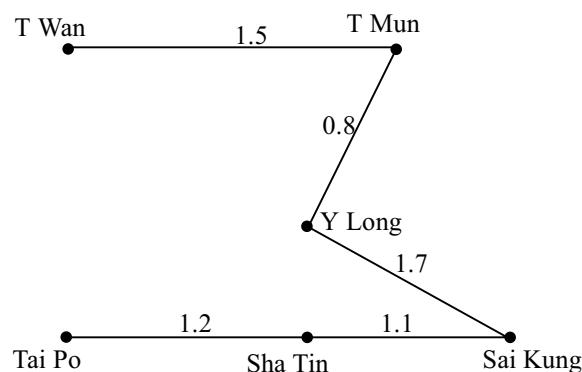

ii) (a) Let  $p$  = interest rates go up.  
 $q$  = stock market prices will go down,  
 $p \rightarrow q$   
 $\neg p$   
 $\therefore \neg q$

(b) The argument in ii)(a) is invalid.

**B3. i)**  
 (a)

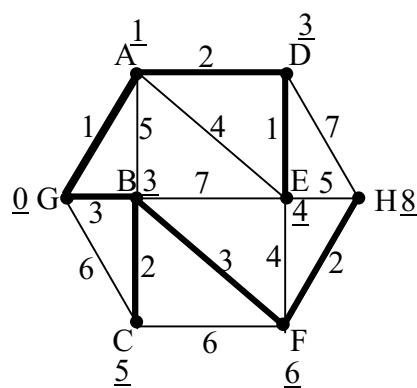

b)

c)  $\min \text{ cost} = 1.5 + 0.8 + 1.7 + 1.1 + 1.2 = 6.3$  (millions)

ii)

Therefore, the shortest distance from G to D = 3

$$E = 4$$

$$F = 6$$

$$H = 8$$

<p><b>B4</b></p> <p>i) (a) <math>\mu = 100, \sigma = 16</math>,</p> $\begin{aligned} P(X > 120) &= P[Z > (120-100)/16] \\ &= P[Z > 1.25] \\ &= 0.1057 \end{aligned}$ <p>(b) <math>P[Z &gt; (X-100)/16] = 0.2</math>  <math>(X-100)/16 = 0.84</math>  <math>X = 113.4</math></p> <p>ii) (a) <math>P(\text{exactly 2 defective}) = {}_{10}C_2 (0.02)^2 (1-0.02)^8</math>  <math>= 0.01531</math></p> <p>(b) <math>P(\text{2 or more will be defective})</math>  <math>= 1 - P(\text{no defective}) - P(\text{exactly 1 defective})</math>  <math>= 1 - 0.98^{10} - 10 \cdot 0.02 \cdot 0.98^9</math>  <math>= 0.0162</math></p>
